CONCLUSIONS

PROBLEM STATEMENT

The main idea of this project was to develop a framework by using classification models to predict the loan defaulter in banking to minimise the risk of losing money while lending to customers.

WHAT HAVE DONE

- Data preparation and defining the correlation between features.
- Training the dataset on 4 classifiers.
- Comparing between the models, in which the Random Forest showed the best score on F1.

MODELS AND RESULTS

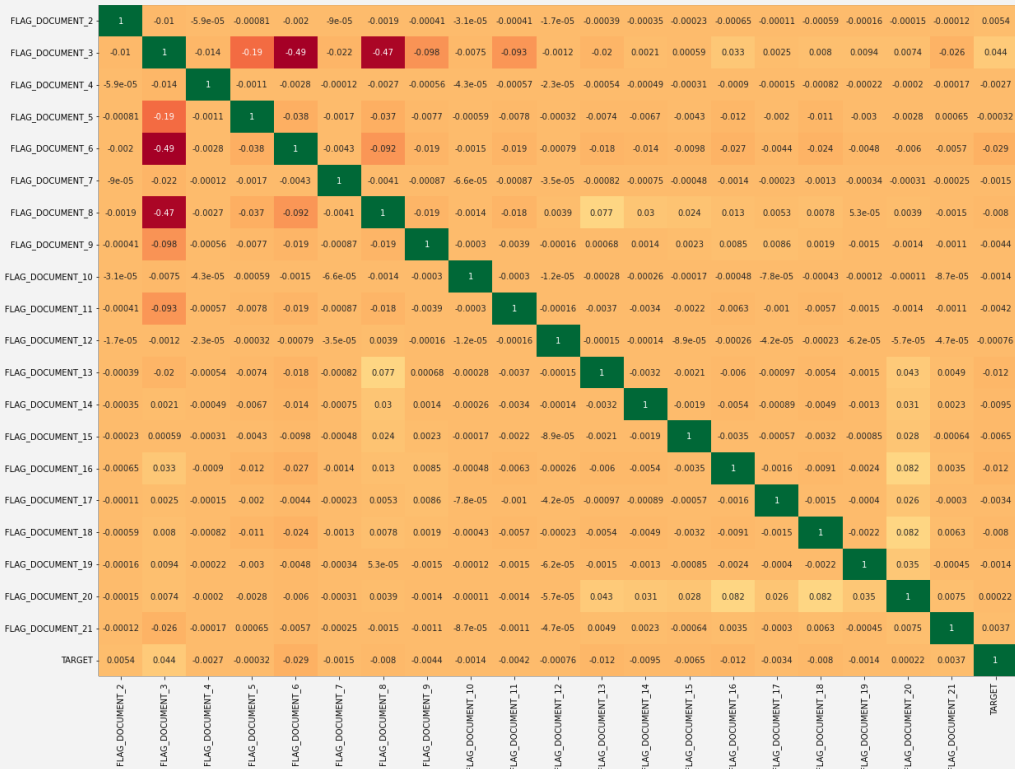

TARGET FEATURE DISTRIBUTION

Percentage of Target variable

FEATURES CORRELATIONS

THE CLASSIFIERS MODELS

- ✓ Logistic regression (LR)
- ✓ K-nearest neighbours (K-NN)
- ✓ Decision Tree (DT)
- ✓ Random Forest (RF)

RESULTS FOR 4 MODELS

Model	Function	Precision	Recall	Accuracy	F1
Logistic regression (LR)	LogisticRegression	0.87	0.54	0.91	0.64
K-nearest neighbours (K-NN)	KNeighborsClassifier	0.86	0.91	0.92	0.84
Decision Tree (DT)	DecisionTreeClassifier	0.88	0.61	0.84	0.70
Random Forest (RF)	RandomForestClassifier	0.85	0.92	0.92	0.88
